

IMPLEMENTATION GUIDE: How To Use Each Deliverable

Lorespinner Pipeline Upgrade — May 2026

Step-by-step instructions for implementing each deliverable into the existing Logic Companion pipeline. Ordered by implementation sequence — do them in this order.

BEFORE YOU START

You need:

- The existing Logic Companion v1.1 (the pipeline prompt chain)
- The existing Chaos System Prompt (the runtime narrator)
- All 9 deliverable files (each contains a copy-paste-ready prompt)
- A test IP to validate against (Anima Machina recommended — it already has a complete extraction)

PHASE 1: FOUNDATION (Implement First — No Pipeline Changes Required)

These two deliverables are standalone. They add new jobs without touching anything that already exists.

STEP 1: Add the IP Trimming Agent

File: DELIVERABLE 7 - IP TRIMMING AGENT PROMPT

What to do:

1. Open Deliverable 7. Find the line "COPY-PASTE PROMPT BELOW THIS LINE."
2. Copy everything below that line. This is the complete prompt for a new pipeline job.
3. Add this as a new job in the pipeline that runs BEFORE Format Detection. It is the first job in the chain.
4. To run it: paste the prompt into a new AI session, upload the COMPLETE source IP (full novel, full screenplay), and let it process.
5. Save the output. It has 5 sections: Story Spine, World Rules, Content Triage Log, Conversion Notes, and the Trimmed Source Text.
6. The Trimmed Source Text is what you feed to Format Detection and all subsequent phases (except Voice Lock, which gets the full original).

Test it: Run it on the Anima Machina screenplay. The trimmed version should be 25-45% smaller. Check that all dialogue is preserved, all character names are preserved, and the Story Spine hits every major turning point.

Time estimate: 1-2 hours to add the job slot and run the first test.

STEP 2: Add the Voice Lock Phase

File: DELIVERABLE 1 - VOICE LOCK PHASE PROMPT

What to do:

7. Open Deliverable 1. Find "COPY-PASTE PROMPT BELOW THIS LINE."
8. Copy everything below that line.

9. Add this as a new job in the pipeline that runs AFTER Phase 1 (IP Audit) and BEFORE Phase 2 (Story Session Map).
10. To run it: paste the prompt, fill in the header fields (Master Context, Phase 1 Audit, Format Detection output), and upload the COMPLETE ORIGINAL source IP (NOT the trimmed version — voice extraction needs everything).
11. Save the output. It is the Voice Profile Document with 3 sections: Voice DNA Profile, Master Rule 1 Hard Ban List, and the 14-Point Audit Protocol.
12. This document becomes constitutional law. Reference it in every subsequent phase.

Test it: Run it on the Anima Machina screenplay. Check: does the Voice DNA capture Thomas's actual writing techniques (short declarative hits, physical grounding, dialogue-as-evasion)? Does the ban list catch the patterns you've seen AI produce? Read the signature techniques — would they produce prose that sounds like Thomas, not like generic AI?

Time estimate: 1-2 hours to add the job slot and run the first test.

PHASE 2: CORE UPGRADE (Deploy All Five Together)

These five deliverables update existing pipeline phases. They MUST be deployed together because their outputs feed each other. Deploying one without the others breaks the data chain.

Deployment order within this phase: 2 → 3 → 4 → 5 → 6

STEP 3: Swap Phase 2 — Story Session Map

File: DELIVERABLE 2 - UPDATED PHASE 2 STORY SESSION MAP

What to do:

13. Open Deliverable 2. This one is structured as ADDITIONS to the existing Phase 2 prompt, not a full replacement.
14. Open your existing Phase 2 prompt.
15. Find the end of Task 5 (Branch Dimension Definitions) in the existing prompt.
16. Copy the 4 new tasks from Deliverable 2 (Task 6: Persistent State Schema, Task 7: World Reactivity Rules, Task 8: StoryGuard Canon Extraction, Task 9: Story-Native Alignment Labels) and paste them AFTER Task 5.
17. Update the OUTPUT FORMAT section at the end of the existing prompt to include the new tasks.
18. Update the STOP verification block to include the new checks.

What changes in the output: Phase 2 now produces a much larger payload — the original 5 tasks plus 4 new blocks. Every subsequent phase references this expanded output.

Test it: Run the updated Phase 2 on Anima Machina. Check: does the NPC Registry include Riven, Jace, Lena, Mother? Does the Object Inventory include the cracked camera lens? Do the World Reactivity Rules feel authentic to Anima Machina's world? Does the StoryGuard Canon Extraction correctly identify what can and cannot exist?

Time estimate: 30 minutes to append the new tasks. 1-2 hours to test.

STEP 4: Swap Phase 4 — Beat Architecture

File: DELIVERABLE 3 - UPDATED PHASE 4 BEAT ARCHITECTURE

What to do:

19. Open Deliverable 3. Find "COPY-PASTE PROMPT — REPLACES EXISTING PHASE 4."

20. Copy everything below that line.
21. REPLACE the entire existing Phase 4 prompt with this new version.
22. Note the new input requirements at the top: this phase now also takes the Voice Profile as input (Section 1 only — Voice DNA Profile).

Key differences from the old Phase 4:

- The beat map now includes three interaction types (branching, emotional, posture shifts) instead of two
- A new Task 3 (Episode Content Budget) calculates word counts
- A new Task 4 (Posture Shift Placement) designs each in-narration interaction
- Session timing updated for 20-30 minutes

Test it: Run it on Anima Machina Session 1. Verify: exactly 4 branching choice slots, 4-6 emotional choice slots, 6-10 posture shift slots. Content budget between 3,500-4,200 words. Breath beat between minutes 10-13.

Time estimate: 15 minutes to swap. 1-2 hours to test.

STEP 5: Swap Phase 5 — Choice Design

File: DELIVERABLE 4 - UPDATED PHASE 5 CHOICE DESIGN

What to do:

23. Open Deliverable 4. Find "COPY-PASTE PROMPT — REPLACES EXISTING PHASE 5."
24. Copy everything below that line.
25. REPLACE the entire existing Phase 5 prompt.
26. Note the expanded input requirements: this phase now takes Phase 2 Tasks 6, 7, and 8 (persistent state, world reactivity, StoryGuard), plus the Voice Profile (Sections 1 and 2).

Key differences from the old Phase 5:

- 4 branching choices instead of 3
- Every choice has chaotic/lawful/neutral alignment mapping (internal only)
- Every branching choice has a StoryGuard Manifest for freeform input
- Every choice has Persistent State Changes
- Every significant state change has a World Noticed Signal
- A new Task 8 writes Social Echo defining lines
- Posture shifts are finalized from Phase 4 placements

This is the largest output change. The Phase 5 payload is significantly bigger than before because every choice now carries alignment, state changes, manifests, and signals.

Test it: Run on Anima Machina Session 1. Check: are the three options per choice genuinely different? Are alignments never visible in the option text? Do the StoryGuard manifests provide clear fold-back paths? Are the World Noticed signals in Thomas's voice, not gamey?

Time estimate: 15 minutes to swap. 2-3 hours to test (this is the most complex phase).

STEP 6: Swap Phase 6 — Consequence Mapping

File: DELIVERABLE 5 - UPDATED PHASE 6 CONSEQUENCE MAPPING

What to do:

27. Open Deliverable 5. Find "COPY-PASTE PROMPT — REPLACES EXISTING PHASE 6."
28. Copy everything below that line.

29. REPLACE the entire existing Phase 6 prompt.

30. Note expanded inputs: now takes Phase 2 Tasks 5, 6, and 7 (branch dimensions, persistent state, world reactivity).

Key differences from the old Phase 6:

- 4 branching choices mapped instead of 3
- 3 new columns per path: World State Deltas, Reactivity Triggers, Cross-Episode State Propagation
- New Task for Reactivity Trigger specifications
- New Task for Cross-Episode Propagation Rules
- New Task for Freeform Consequence Guidelines
- New validation checks (state consistency, reactivity coherence)

Test it: Run on Anima Machina Session 1. Check: do the World State Deltas match the Persistent State Changes from Phase 5? Are the reactivity triggers specific ("Riven opens with 'You again'") not generic ("the NPC acts differently")?

Time estimate: 15 minutes to swap. 1-2 hours to test.

STEP 7: Swap Phase 8 — Editorial Verification

File: DELIVERABLE 6 - UPDATED PHASE 8 EDITORIAL VERIFICATION

What to do:

31. Open Deliverable 6. Find "COPY-PASTE PROMPT — REPLACES EXISTING PHASE 8."

32. Copy everything below that line.

33. REPLACE the entire existing Phase 8 prompt.

34. Note expanded inputs: now takes the complete Voice Profile (all 3 sections), Persistent State Schema (Phase 2 Task 6), and StoryGuard Canon Extraction (Phase 2 Task 8).

Key differences from the old Phase 8:

- 23 questions instead of 10
- New Section B: Voice Audit (7 questions including the full 14-point protocol execution)
- New Section C: StoryGuard and State Compliance (6 questions)
- New scoring: 23/23 green, 20-22 amber, below 20 red

Test it: Run on a completed Anima Machina session design. The voice audit (Q11-Q16) should catch any AI tells. The state compliance audit (Q17-Q23) should catch any data mismatches between Phase 5 and Phase 6.

Time estimate: 15 minutes to swap. 1 hour to test.

PHASE 3: RUNTIME (After Core Upgrade Is Tested)

STEP 8: Build the Assembly Job and Deploy the Runtime Template

File: DELIVERABLE 8 - GENERALIZED RUNTIME NARRATOR TEMPLATE

What to do:

35. Open Deliverable 8. The template has two parts:

- The TEMPLATE itself (17 sections with `{{SLOT}}` placeholders)
- The ASSEMBLY JOB REFERENCE table at the bottom (maps every slot to its source phase)

36. Build the assembly job. This is a script/job that:

- Reads all phase outputs for a given IP + episode
- Fills every `{{SLOT}}` in the template with the corresponding phase output
- Validates the total character count stays under 65,000
- Outputs a complete, ready-to-use runtime system prompt

37. The assembly job reference table tells you exactly where each slot's data comes from:

- `{{IP_TITLE}}` ← Format Detection
- `{{VOICE_DNA}}` ← Voice Lock Task 1
- `{{MASTER_RULE_1}}` ← Voice Lock Task 2
- `{{STORYGUARD_LAYER_1}}` ← Phase 2 Task 8
- `{{SESSION_PACKET}}` ← Phases 4-6
- ... and so on (full table in the deliverable)

38. The sections marked [HARDCODED] (Sections 14, 15, 16, 17) are identical for every IP. Copy them verbatim into every assembled prompt.

39. The sections marked [RUNTIME] (Section 7: Persistent World State, Section 8: Symbolic Memory, Section 10: Arc Position) are updated by the runtime state manager each turn during gameplay.

40. TIERED STATE LOADING: The runtime state manager must implement three tiers:

- Tier 1 (every turn): current objects, current scene NPCs, alignment summary, location flags
- Tier 2 (when scene-relevant): emotional ledger entries related to current scene, connected location flags
- Tier 3 (episode transitions + climactic moments): full NPC registry, complete action history, cross-episode propagation data

Test it: Assemble a complete runtime prompt for Anima Machina Session 1 using all phase outputs. Check: is the total under 65,000 characters? Does every section contain real data (no unfilled slots)? Read the assembled prompt — does it feel like a coherent narrator instruction, not a patchwork of templates?

Time estimate: This is the biggest engineering task. Building the assembly job: 1-2 days. Testing and iterating: 1-2 days.

PHASE 4: SOCIAL LAYER (After Core Experience Is Live)

STEP 9: Implement the Social Echo Layer

File: DELIVERABLE 9 - SOCIAL ECHO LAYER SPECIFICATION

What to do:

41. This is NOT a prompt to copy-paste. It is a product specification.
42. Share it with the product and engineering team (Shervin, Mike, Spencer).
43. Implementation requires:
 - An aggregate data pipeline that collects choice percentages across all players
 - Share card visual design (story-branded, platform-optimized)
 - Social platform integration (Instagram Stories, Twitter/X, TikTok, iMessage)
 - Optional: friend graph for divergence comparisons
44. The pipeline already produces the data the Social Echo needs:

- Alignment tendency per episode (from runtime state)
- Defining lines per branching choice per path (from Phase 5 Task 8)
- Story-native alignment labels (from Phase 2 Task 9)

45. The runtime state manager needs to persist the share card data structure (specified in the deliverable) at SESSION_COMPLETE.

Test it: After a player completes an episode, verify: does the share card show the correct alignment tendency? Is the defining line from the choice they actually made? Are the comparison percentages accurate?

Time estimate: This is a product feature build. Spec review: 1 day. Engineering implementation: 1-2 weeks. Design work runs in parallel.

QUICK REFERENCE: WHAT TO COPY-PASTE WHERE

Deliverable	Action	Where in Pipeline
D7: IP Trimming Agent	Add as NEW first job	Before Format Detection
D1: Voice Lock	Add as NEW job	After Phase 1, before Phase 2
D2: Phase 2 Update	APPEND 4 new tasks to existing prompt	Phase 2
D3: Phase 4 Update	REPLACE entire Phase 4 prompt	Phase 4
D4: Phase 5 Update	REPLACE entire Phase 5 prompt	Phase 5
D5: Phase 6 Update	REPLACE entire Phase 6 prompt	Phase 6
D6: Phase 8 Update	REPLACE entire Phase 8 prompt	Phase 8
D8: Runtime Template	Build assembly job + deploy template	End of pipeline (replaces hand-crafted Chaos)
D9: Social Echo	Product spec for engineering team	Post-experience feature

IMPLEMENTATION TIMELINE

Week	What Ships	Dependencies
Week 1	D7 (Trimming Agent) + D1 (Voice Lock)	None — standalone jobs
Week 2	Test D7 + D1 on 2-3 IPs	Week 1 complete
Week 3	D2 + D3 + D4 + D5 + D6 (all five phase swaps)	Week 2 validated
Week 4	Test full pipeline on 1 IP end-to-end	Week 3 complete
Week 5	D8 (Assembly Job + Runtime Template)	Week 4 validated
Week 6	Test runtime on live sessions	Week 5 complete
Week 7-8	D9 (Social Echo)	Core experience working

IF SOMETHING BREAKS

Phase 5 output is too large: The expanded choice designs (alignment + state changes + manifests + signals + defining lines) produce a bigger payload. If this causes token issues in the pipeline, compress the StoryGuard manifests to terse rule lists instead of full prose.

Runtime template exceeds 65k characters: Compress Section 12 (episode script) first — use the Trimming Agent's trim markers to identify further cuttable material. If still over, reduce Voice Profile examples in Section 4 from quoted examples to technique names only.

Phase 8 flags too many voice violations: This is expected on the first run. The 14-point audit is strict by design. Fix violations in the generating phase, re-run only the failed Phase 8 questions.

Data mismatch between Phase 5 and Phase 6: Phase 5 specifies state changes per choice. Phase 6 specifies state deltas per path. These MUST match. If Phase 8 Q20 (State Consistency) fails, reconcile the data in Phase 5 first, then re-run Phase 6.

END OF IMPLEMENTATION GUIDE
